

Does rotary non-percussive drilling cause rock failure?

According to the analysis on the SE values at different drilling conditions in rotary non-percussive drilling, the rock failure before the bit is more related to rotary shear than the axial force. Table 2. Calculation of SE based on different drilling parameters in the field test.

What is rock rotary cutting & penetration drilling test?

Different rock combinations are taken as test objects. The rock rotary cutting and penetration drilling test is performed with different rock assemblages as the test objects. The response of the drilling parameters, such as rotational speed, to rock mass is studied in the process of drilling.

How rotary non-percussive drilling machine can be monitored?

To facilitate the monitoring of the drilling process, a new drilling-monitoring system was developed for the conventional rotary non-percussive drilling machine by improving Yue's (2004) innovative drilling process monitoring (DPM) adopted in field drilling.

Can rotary cut drills predict rock strength?

Extensive studies have been conducted on drilling exploration and the prediction of rock strength to investigate the interaction between machinery and rock during rotary cut borehole operations. Indoor drilling tests were conducted on rock materials and mortar materials using a self-developed rotary cut digital drilling system.

What are the optimal rotary drilling conditions?

The optimal rotary drilling conditions in the field can be successfully obtained by the modified SE model first proposed by Teale (1965) that only includes a few control parameters (such as thrust, rotation speed, and bit diameter).

Does rotary non-percussive drilling affect specific energy and rate of penetration?

In this study, a field-drilling test is performed using a rotary non-percussive drilling machine equipped with a new drilling-monitoring system to investigate the effects of drilling parameters on the specific energy (SE) and rate of penetration (ROP).
