How do I hone a cylinder?

To hone a cylinder, we recommend using our HO-10 Honing Oil. Make sure your guide blocks are not too tight, and that the hone expands after being placed in the cylinder. The honing stones should contact the cylinder first, and the guide blocks should have about .010" to .030" clearance.

Can You Tumble a fractured rock before polishing?

Remove any rocks with fractures before the polishing stage. You can break them along the fracture and re-tumble them in another batch. Be of appropriate size - Tumbling rough should generally be composed of a good mix of rocks between 1/2" and 1-1/2" in size.

How do you Polish tumbling rocks?

The shaping of the rocks happens primarily in the first and second steps of tumbling, but those steps also set the stage for a good polish. Make sure that the rocks have had long enough to wear away any irregularities, voids, and cracks that may trap grit and make it difficult for the polish to do its work.

How do you hone a gas cylinder?

To hone a gas cylinder, start by using filtered oil and ensuring your guide blocks are not too tight. Place the hone in the cylinder and then expand it. The guide blocks should have about .010" to .030" clearance. To apply more pressure, try narrowing your stones.

Why are my rocks hard to remove?

This can be because of hard water or the polishing slurry drying onto the rocks, making it difficult to remove. One of the best ways to determine if this is the case is to use a high-powered magnifying glass (link to Amazon) to inspect the surface of your rocks.

How can I prevent a cylinder from tapering?

To prevent taper in a cylinder, use special honing stones designed for short or blind holes. These stones exert more pressure at the bottom and are available from Goodson Tools & Supplies. Dwelling at the web end is not a solution as it removes too much material from the center and causes a barrel-shaped cylinder.
