

# Pumping

Why is pumping important?

Pumping helps remove breast milk from your breasts, which stimulates and maintains milk production, especially if your baby isn't nursing directly. Over time, regular pumping can help establish or increase milk supply.

What is pumping a baby?

It's a way to get milk for your baby when you can't or don't want to breastfeed in person. For moms, pumping provides flexibility, allowing you to build a milk stash and ensure your baby has access to breast milk even when you're not available to nurse.

What is power pumping & how does it work?

Power pumping boosts your milk supply by mimicking a baby's "cluster feeding," a term for a period during which your baby feeds more frequently than usual (usually because of a growth spurt). Both are thought to ramp up the production of prolactin, a hormone that stimulates breast milk production.

Why is double pumping important?

Double pumping also provides very strong stimulation to keep a good milk supply. Prolactin, which is an important hormone for making milk, becomes very elevated when mothers double pump. Is there any way to decrease the number of times I have to pump at work?

When should I start pumping?

You should start pumping whenever it makes sense for you. The right time will depend a lot on your situation. Some new moms begin pumping right after their baby is born -- in the hospital or birthing center -- to help initiate breastfeeding or to encourage their milk supply.

When should I start pumping my baby?

Consider pumping a few weeks before returning to work or school, or when you'll be away from your baby. This will give you the chance to practice pumping. It also will give your baby time to get used to feeding from a bottle. When away from your baby or exclusively pumping, match your pumping frequency to how often your baby drinks breast milk.

If you've heard of power pumping you may be wondering if a change to your breast pumping schedule can really help boost your supply. Learn more about what power pumping ...
